

Today's Agenda :-

- 1) Compound Joins
- 2) Types of Joins
- 3) Cross Joins
- 4) USING
- 5) NATURAL
- 6) Implicit Join
- 7) Join with WHERE vs ON
- 8) UNION

Compound Joins :-

↳ Joins having multiple condition

Film :-

for every film, name all the film
that were released within ± 2 years
of that film & their rental rate was
greater than rental rate of that movie

Film (f_1)

| Name | rel-year | rental |
|--------|----------|--------|
| Sholay | 2000 | 2 |
| KKHH | 1999 | 3 |
| MHN | 1998 | 2 |
| KKKG | 1997 | 4 |

Film (f_2)

| Name | rel-year | rental |
|--------|----------|--------|
| Sholay | 2000 | 2 |
| KKHH | 1999 | 3 |
| MHN | 1998 | 2 |
| KKKG | 1997 | 4 |

| | |
|--------|------|
| Sholay | KKHH |
| KKHH | KKKG |
| MHN | KKHH |
| MHN | KKKG |

Select $f_1.name, f_2.name$
 from film f_1
 join film f_2
 on ($f_2.release_year$ between $f_1.release_year - 2$
 AND $f_1.release_year + 2$) &
 $(f_2.rental_rate > f_1.rental_rate)$

$f_2 \geq f_1 - 2 \text{ } \& \& \text{ } f_2 \leq f_1 + 2$

$f_2 \text{ between } f_1 - 2 \text{ } \& \& \text{ } f_1 + 2$

1) Joins does not need to happen on
 equality of columns.

2) Joins can have multiple columns.

Types of Join :-

Student

| id | Name | batch_id |
|----|-------|----------|
| 1 | John | 1 |
| 2 | Jane | 1 |
| 3 | Tim | NULL |
| 4 | Jenny | NULL |
| 5 | Jack | 2 |

Batches

| id | Name |
|----|------|
| 1 | A |
| 2 | B |
| 3 | C |

Select s.name, b.name

from Students s
 join Batches b
 on s.batch_id = b.id

→ creates an intermediate table.

Student

| id | Name | batch_id |
|-----|-------|----------|
| ✓ 1 | John | 1 |
| ✓ 2 | Jane | 1 |
| X 3 | Tim | NULL |
| X 4 | Jenny | NULL |
| ✓ 5 | Jack | 2 |

Batches

| id | Name |
|----|------|
| 1 | A |
| 2 | B |
| 3 | C |

Intermediate table

| | | | | |
|---|------|---|---|---|
| 1 | John | 1 | 1 | A |
| 2 | Jane | 1 | 1 | A |
| 5 | Jack | 2 | 2 | B |

Output

| | |
|------|---|
| John | A |
| Jane | A |
| Jack | B |

left { 3
join } 5 Jim NULL NULL NULL
 Jenny " " "

When we do a join b/w tables

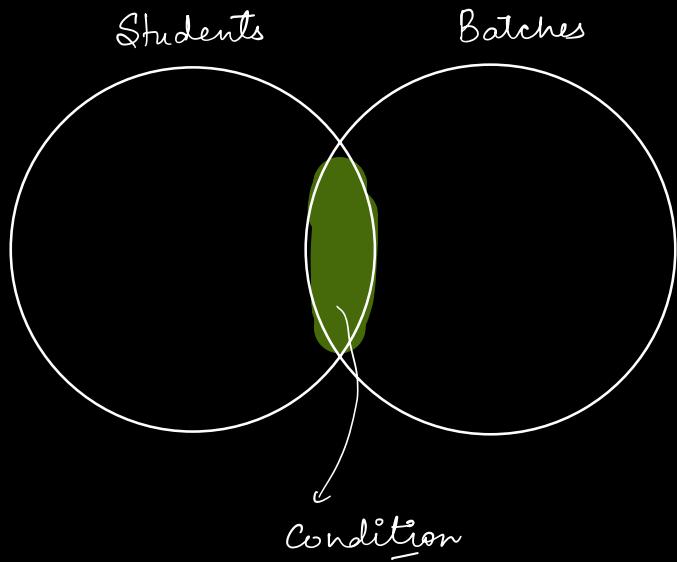

from L
join R

If a row of the left doesn't match with any row of right , it'll not be included in your answer & vice versa.

↓
Inner Join

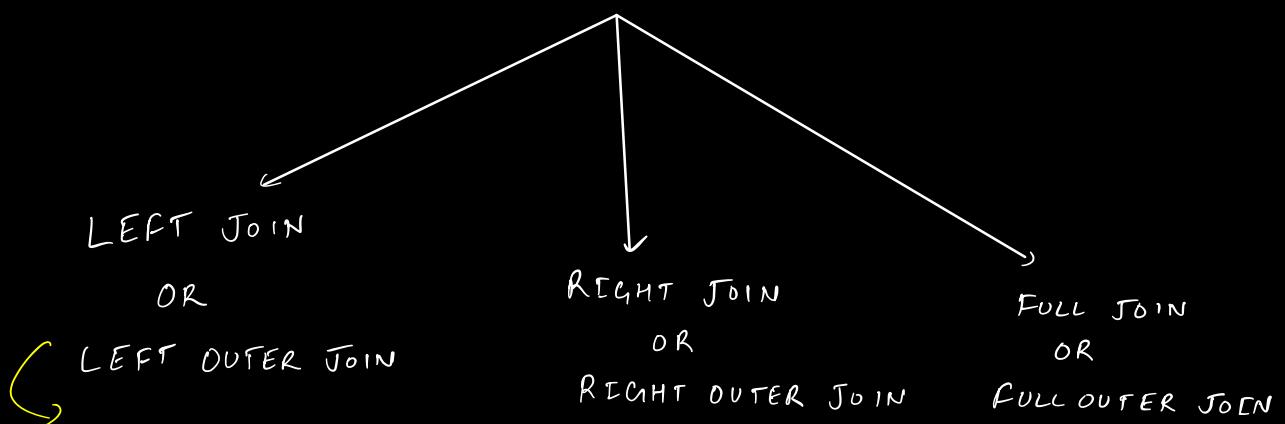

Inner Join :- Join that includes only rows

of both tables that matches conditions

OUTER JOIN :-

Join that allows rows that don't match the condition as well.

1) includes all rows that matches condition

2) includes all rows of left table that don't match the condition.

left
join

3) for these rows, we will file NULL on the
other side }

| Student | | | Batches | | |
|-----------|-------|----------|-----------|------|--|
| <u>id</u> | Name | batch_id | <u>id</u> | Name | |
| 1 | John | 1 | 1 | A | |
| 2 | Jane | 1 | 2 | B | |
| 3 | Jim | NULL | 3 | C | |
| 4 | Jenny | NULL | | | |
| 5 | Jack | 2 | | | |

```
Select S.name, b.name  
from Students S  
left join Batches b  
on S.batch_id = b.id
```

| | | |
|-------|------|---|
| John | A | } |
| Jane | A | |
| Jack | B | |
| Tim | NULL | } |
| Jenny | NULL | |

(l) table 1 =

(a) table 2 =

ans =

```
for each row1 in table1 :  
|   for each row2 in table2 :
```

```
    |  
    |     if (cond is T) {  
    |     |         ans.add (row1 + row2)  
    |     }  
    }  
}
```

for each row in table1 :

```
    |     if (row not in ans) {  
    |     |         ans.add (row + [NULL, N...])  
    }     }  
}
```

for each row in ans

```
    print (row[ ], ... )
```

RIGHT JOIN :-

- 1) includes all rows that matches condition
- 2) includes all rows of right table that don't match the condition.
- 3) for these rows, we will file NULL on the other side

Student

| id | Name | batch_id |
|----|-------|----------|
| 1 | John | 1 |
| 2 | Jane | 1 |
| 3 | Tim | NULL |
| 4 | Jenny | NULL |
| 5 | Jack | 2 |

Batches

| id | Name |
|----|------|
| 1 | A |
| 2 | B |
| 3 | C |

| | |
|------|---|
| John | A |
| Jane | A |
| Jack | B |
| NULL | C |

✓ Right
Join

FULL JOIN :-

- 1) All rows that matches condition
- 2) All rows of left that didn't match
- 3) All rows of right that didn't match

↓
3 Tim NULL

Student

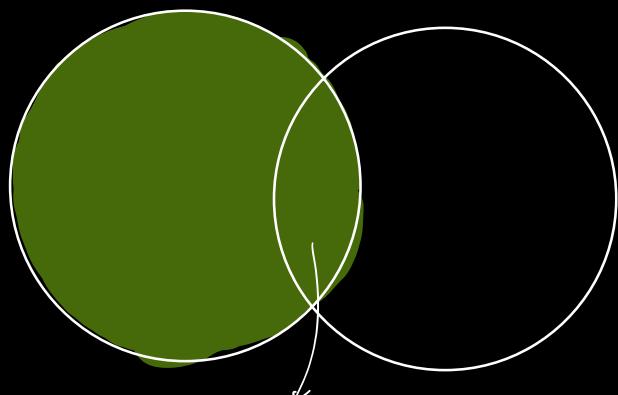

| <i>id</i> | Name | batch_id |
|-----------|-------|----------|
| 1 | John | 1 |
| 2 | Jane | 1 |
| 3 | Tim | NULL |
| 4 | Jenny | NULL |
| 5 | Jack | 2 |

| <i>id</i> | Name |
|-----------|------|
| 1 | A |
| 2 | B |
| 3 | C |

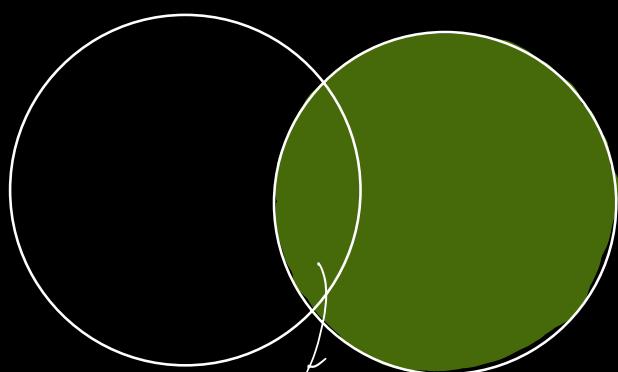

}

| | |
|-------|------|
| Jack | B |
| Tim | NULL |
| NULL | C |
| Jane | A |
| Jenny | NULL |
| John | A |

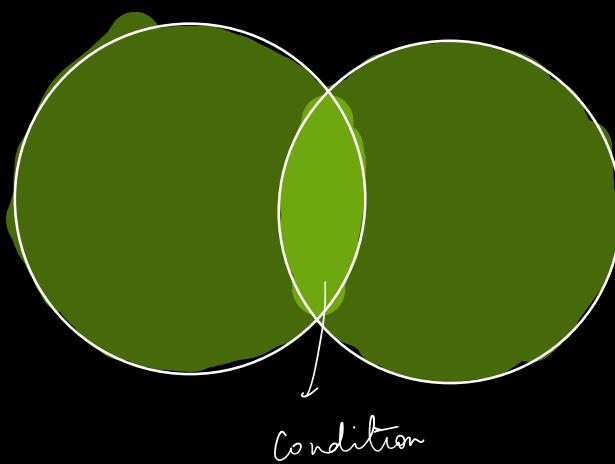

→ free join

left
Join

Right
Join

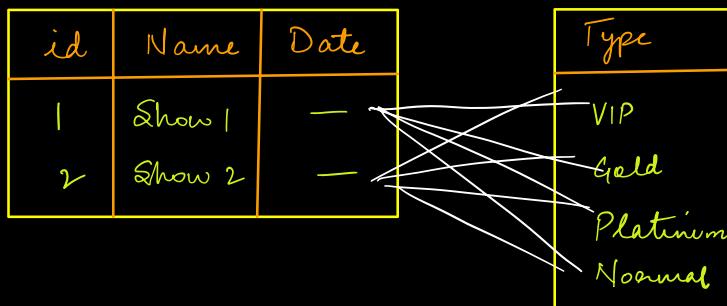

full Join

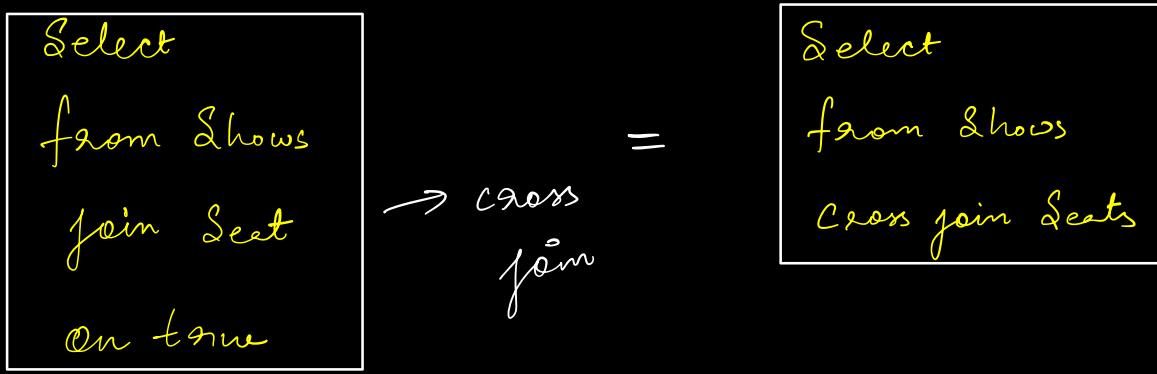

Condition

Cross Join :- does not require any condition
returns all pairs of rows

Show Types Seat Types

| | |
|--------|----------|
| Show 1 | VIP |
| Show 1 | Gold |
| Show 1 | Platinum |
| Show 1 | Normal |
| Show 2 | VIP |
| Show 2 | Gold |
| Show 2 | Platinum |
| Show 2 | Normal |

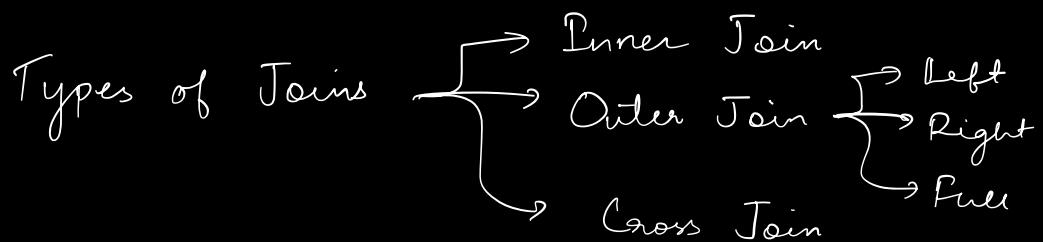

$$\left. \begin{array}{l} N \text{ rows in } t_1 \\ M \text{ , , } t_2 \end{array} \right\} \frac{N \times M}{}$$

Is Full Join is same as Cross Join ?

$A + B$

$A * B$

Break of 7 Min

USING :-

1) Joining based on equality

2) Name of column are same on both sides

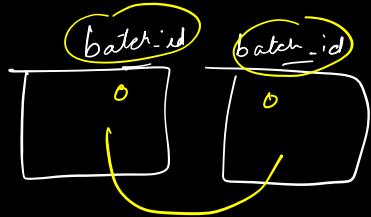

Select s.name, b.name

from Students s

join Batches b

on s.batch_id = b.id

X

Select
from Student

join Batches

using (batch_id)

NATURAL JOIN :-

Whenever you want to join 2 tables based

on equality of all columns having same

name in both .

t_1

| | | | | |
|---|---|---|---|---|
| a | b | c | d | e |
|---|---|---|---|---|

t_2

| | | | | | |
|---|---|---|---|---|---|
| g | h | i | c | d | b |
|---|---|---|---|---|---|

Select *

from t_1

join t_2

①

on $t_1.b = t_2.b$ & $t_1.d = t_2.d$ & $t_1.c = t_2.c$

Select *

from t_1

②

join t_2

using (b , d , c)

Select *

③

from t_1

natural join t_2

→ automatically consider
all columns having
same name in
both tables.

IMPLICIT JOIN :- Joining tables without using
the join keyword.

↓
Cross Join

Select *

from A, B

↓

Same as

Cross join

Stick every row
of A with every
row of B

Select s.name, b.name
from Students s
join Batches b
on s.batch_id = b.id

Select s.name, b.name
from Students s, Batches b
where s.b_id = b.id

①

②

Join with ON vs Join with where
(Normal Join) > (Implicit join)

Join with ON :-

$A = []$

$B = []$

$ans = [] // \rightarrow$ contains only filtered pairs of rows which matches the condition

for each row1 in A

Joins with

ON

for each row2 in B

if (cond is T)

ans.add(row1 + row2)

for each row in ans

print (row[...], row[...])

Joins with where :-

$\text{ans} = [\]$ // contains all pairs of rows like
for each row in A Cross Join

for each row in B

$\text{ans} \cdot \text{add}(\text{row1} + \text{row2})$

for each row in ans

if(^{where} cond is T) // where

$\text{Print}(\text{row}[\dots], \text{row}[\dots])$

Joins with ON

ON gets applied at the
time of creating the

Intermediate table

better performance

less memory

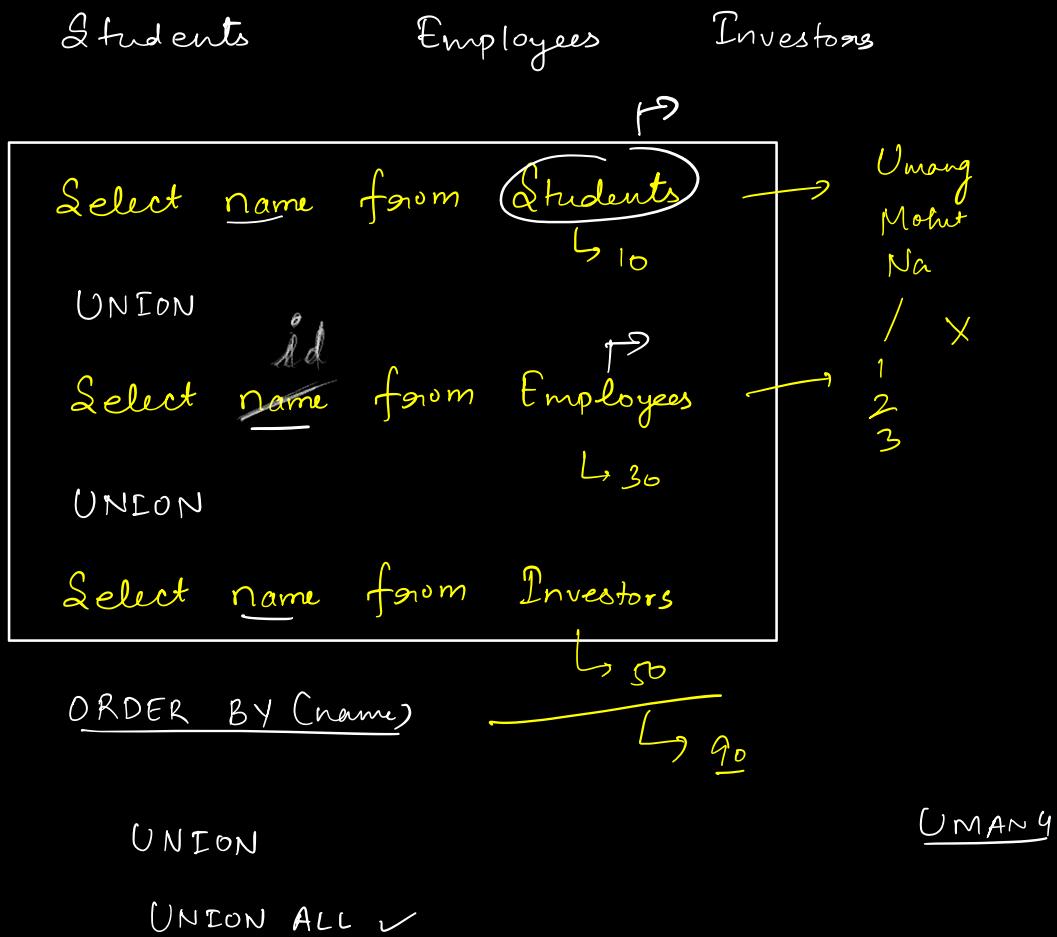

Joins with WHERE

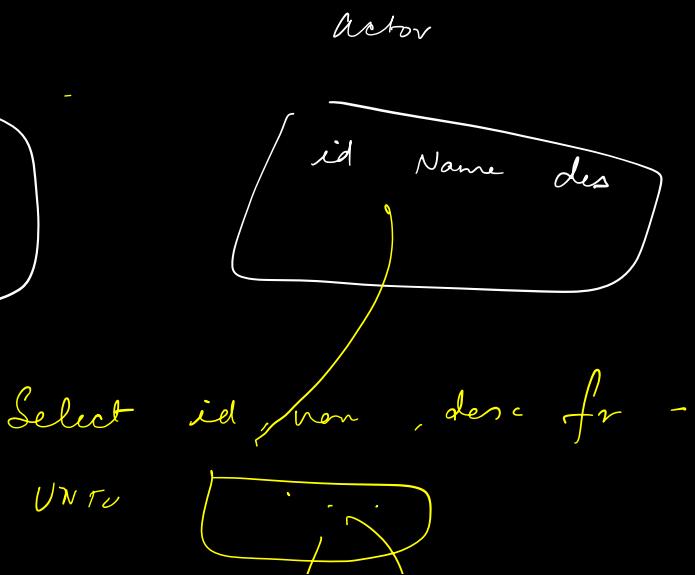

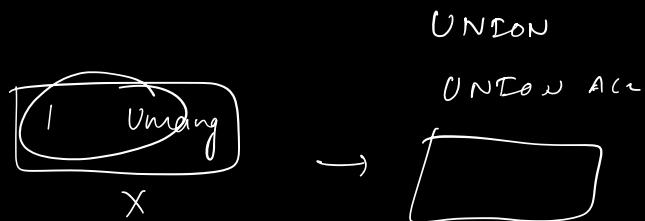

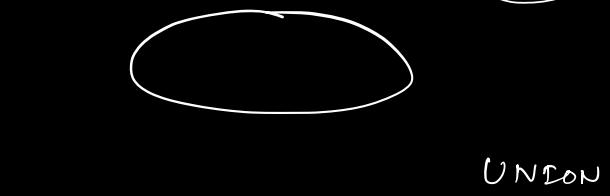

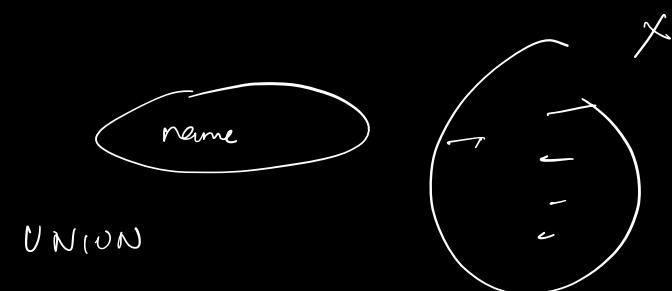

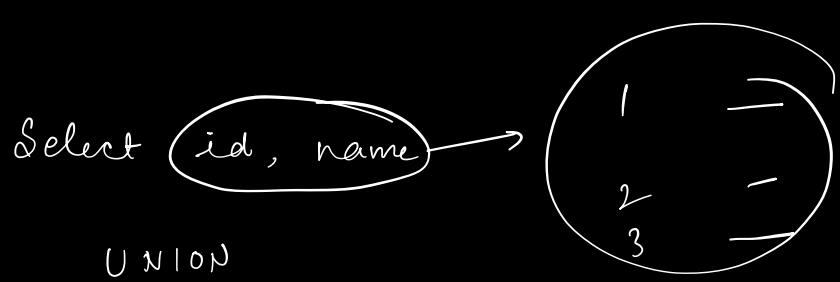

WHERE gets applied
at finally printing

slow per

more memory

UNION :-

Select id, name, desc for -
